3rd March 2026

Dear Hiring Team,

I am writing to apply for the Student Assistant position focused on AI-based threat analysis at Fraunhofer IEM. What drew me to this role is the combination of AI, software engineering, and security—especially the idea of building tools that can actively support developers in identifying and mitigating risks early in the development process.

I am currently pursuing my Master's in Computer Engineering at Paderborn University. In my current project, I work on applying data-driven techniques to a systems engineering use case, where I also take on the role of project manager for my specific use case. In this role, I am responsible for planning and coordinating tasks, assigning responsibilities, and monitoring progress to ensure timely delivery. I also supervise documentation and make sure that quality and documentation standards are consistently met. Additionally, I contribute to suggesting improvements and new features for the solution. This experience has helped me develop a structured way of working and a strong sense of ownership, while also ensuring that project goals are successfully achieved through close coordination within the team.

Alongside this, I have gained hands-on experience in Python development and have worked with AI models, including large language models, particularly in generating structured SysML v2 models. Through this, I've developed a strong interest in how LLMs can be used beyond generation tasks—especially in areas like analysis, automation, and decision support. Applying this to IT security, such as identifying threats or suggesting countermeasures, is something I find particularly exciting.

During my time at PwC, I learned how to work in a fast-paced and demanding environment where delivering reliable results on time is critical. That experience taught me how to stay structured, communicate clearly, and maintain quality even under pressure—skills that I carry into my academic and technical work today.

What excites me most about this position at Fraunhofer IEM is the opportunity to work on something that has both research depth and real-world impact. The idea of developing and integrating AI-based tools into existing environments like IDEs or version control systems is especially interesting to me, as it directly connects with how developers actually work.

Overall, I would describe myself as someone who enjoys learning, takes ownership of tasks, and likes working in collaborative, agile environments. I am eager to contribute my skills and continue growing in the areas of AI and secure software development.

Thank you for your time and consideration. I would be happy to discuss my application further.

Yours Sincerely,
Abhipsa Roy Choudhury
